# Visual Inspection Points for Door Hardware

Okay, lets talk about door hardware. Specifically, lets break down what you should be looking at when you give your door hardware a good, old-fashioned visual inspection. Its not the most glamorous task, Ill admit, but keeping an eye on these things can prevent a lot of headaches (and potential security breaches) down the line. Think of it as a quick health check for your doors.

First off, lets consider the hinges. Are they securely fastened to both the door and the frame? Look for any signs of loosening, like screws that are backing out or stripped screw holes. A good test is to simply wiggle the door. If its got a lot of play, thats a red flag. Also, take a peek for rust or corrosion. A little surface rust might not be a huge deal, but significant corrosion can weaken the hinge and eventually lead to failure. Are the hinge pins in place? Missing pins are an open invitation for trouble.

Next up, the doorknob or lever. Give it a feel. Does it turn smoothly? Does it latch properly? Any sticking or grinding noises should be investigated. Check the set screws that hold the knob or lever in place. Are they tight? A loose doorknob is annoying and can be a sign of wear and tear. Look for any signs of damage, like dents, scratches, or cracks. These might seem cosmetic, but they can indicate underlying problems.

Then, we have the lock. The heart of the security system, right? Again, smooth operation is key. Does the key turn easily? Does the deadbolt extend fully and retract smoothly? Pay attention to the strike plate on the door frame. Is it securely fastened? Look for signs of tampering or forced entry, like scratches around the keyhole or damage to the strike plate. Even small signs of attempted entry should be taken seriously.

Dont forget the door closer, if you have one. Is it working properly? Does the door close smoothly and completely? Look for leaks around the closer body. Leaking fluid means the closer is losing pressure and will eventually fail. Make sure the closer arm is securely attached to both the door and the frame.

Finally, give the entire door and frame a quick once-over. Look for any signs of damage that could affect the hardware, like rot, warping, or cracks in the wood. A damaged frame can compromise the security of even the best hardware.

Basically, what were doing here is looking for anything out of the ordinary. Anything that feels loose, sounds strange, or looks damaged should be investigated further. Regular visual inspections, even just a quick glance every now and then, can help you identify potential problems before they become major issues, saving you time, money, and maybe even a little peace of mind. Its a simple task, but a worthwhile one.

## About Torsion spring

A torsion spring is a spring that works by turning its end along its axis; that is, a flexible elastic thing that stores mechanical energy when it is twisted. When it is turned, it puts in a torque in the contrary direction, symmetrical to the amount (angle) it is twisted. There are various kinds: A torsion bar is a straight bar of metal or rubber that goes through twisting (shear tension) about its axis by torque used at its ends. A more fragile form made use of in sensitive tools, called a torsion fiber contains a fiber of silk, glass, or quartz under tension, that is turned regarding its axis. A helical torsion spring, is a metal pole or cord in the form of a helix (coil) that is subjected to turning regarding the axis of the coil by sideways pressures (flexing moments) applied to its ends, turning the coil tighter. Clocks use a spiral wound torsion spring (a type of helical torsion springtime where the coils are around each various other rather than accumulated) often called a "clock spring" or colloquially called a mainspring. Those sorts of torsion springtimes are also used for attic room stairways, clutches, typewriters and various other devices that require near continuous torque for huge angles and even multiple changes.
